Foreword

The great lesson that we learned from the present migration to Europe, is the globalization of causes and effects, which leads to new concepts such as:

Moral ecology

Social economic interference or type of social, global and united, governance of the world

Digital territoriality

A necessary interdependence of the countries' economies

Interdependent economic intelligence beside economic war

The weapons of war or 'thin cows that eat the fat cows', in the Pharaoh's dream, interpreted by Joseph

Preface

My attention was drawn by successfully explaining, step by step, in the simple words a concept as difficult as the global social governance of the world.

My attention was drawn by successfully explaining, step by step, in simple words a concept as difficult as the global social governance of the world.

In our political environment (a totalitarian regime dominant), the risk taken to explain and propose a drafting of governance acts (expression of the interest, terms of reference, is high.

The pedantic boldness, in the statement of innovative projects (the production and transport of freshwater from the sea to the arid lands of the interior of Africa), and structures (the increase in production of electrical energy (15 GW), and/or, refining all our minerals, locally on the continent) leaves us enthusiastic !

The subject seems very technically to me, but in this changing world where knowledge is one of the most shared thing, through digital technology, let us take this opportunity in

order to help the African populations to embrace the vision of the free trade Africa

Free trade forces the decision-maker to surpass himself (become a citizen) and to govern differently (continental and planetary human vision)

Introduction

A suggestion of a collective strategy for the African continent, Alvin TOFFLER says

"If you don't have a strategy, you are part of someone else's strategy."

We propose a ranking, a list of priorities for optimum results with a domino effect, because time and favorable circumstances are also to be apprehended.

The construction of the barrage (on the Nile) by Ethiopia (economic necessity) will seriously reduce the quantities (flows) of the water on which all of Egypt depends. The freshwater project for all Africa can provide a sustainable solution and prevent us from having a water war between countries.

We are declining, for Africa, the offer to acquire nuclear power plants for electricity production because of the danger that it represents, the high implementation cost, the obligation of a social organization of labor and the level of awareness (individual and collective) that our countries have not yet reached.

The basic need of Africa is the production of the freshwater, by desalination of seawater, and the transport of that water

to the arid lands of the interior of continent. The presence of water on those areas makes it possible to plant large quantities of fruit trees and vegetables to ward off famine and food dependence to imports

Africa's energy potential allows for the production of clean, abundant, renewable and cheap electricity

The permanent availability of electricity will open the possibility of REFINING locally on the continent, all minerals, including and in particular crude oil, to obtain the lowest cost of chemical derivatives and petroleum products, such as JET A1 which conditions air fares

Immediately and without delay, Africa will take the shortcut to the use of electric cars and trains, new information and communication technology

In *GOD* we stand - In *GOD*, we remain ! This will be the motto of the continent, where men, thanks to planetary citizenship, induced by the globalized ecology of the FREE SEATING - FREE MOVING - free TRADING will become earthlings, simply, living together (notwithstanding the variation in melanin pigmentation rate) in the cradle and the desirable future of Humanity : 'Africa'
